1. SHADED AREAS ARE TO BE PLUGGED OR MASKED AS REQUIRED.
2. MASKING TAPE, TEMPLATE OR TOOLING MUST BE LOCATED WITH RESPECT TO THE EYEPIECE MOUNTING HOLES
3. RECORD ALL PART NUMBERS, MOD MARKS, OR I D MARKINGS WHICH WILL BE COVERED BY THE ENAMEL COAT. IF THE TRUNNION SHAFT COUNTER DESIGNATIONS ARE ENGRAVED, REMOVE THE WHITE FILTER.
4. a) UNSCREW THE TRUNNION MANUAL ADJUSTMENT KNOB UNTIL THE PRELOADED SPRING FORCES THE KNOB WELL ABOVE THE SURFACE OF THE OPTICAL UNIT PANEL
   b) LIBERALLY APPLY THERMOCONDUCTIVE SILICONE COMPOUND, P/N 1006879, TO THE OUTSIDE DIAMETER OF THE KNOB AS SHOWN DETAIL "A"
   COATING THICKNESS MUST BE AMPLE ENOUGH TO FILL CLEARANCE BETWEEN KNOB OUTER DIAMETER AND PANEL COUNTERBORE (APPROXIMATELY .005 INCH PER SIDE).
   c) DEPRESS THE KNOB TO DISENGAGE THE DRIVE AND SECURE KNOB TIGHTLY TO INSURE A STATIC SEAL.
   d) REMOVE EXCESS SILICONE COMPOUND FROM KNOB AND PANEL SURFACE USING CLEAN DRY TISSUE PAPER
   e) REPEAT STEPS "a" THROUGH "d" APPLY SILICONE COMPOUND TO THE SHAFT MANUAL ADJUSTMENT KNOB.
5. RESTENCIL ALL PART NUMBERS OR I D MARKS WHICH WERE RECORDED IN NOTE 3

2. MASKING TAPE, TEMPLATE OR TOOLING MUST BE LOCATED WITH RESPECT TO THE EYEPIECE MOUNTING HOLES
3. RECORD ALL PART NUMBERS, MOD MARKS, OR I D MARKINGS WHICH WILL BE COVERED BY THE ENAMEL COAT. IF THE TRUNNION SHAFT COUNTER DESIGNATIONS ARE ENGRAVED, REMOVE THE WHITE FILTER.
4. a) UNSCREW THE TRUNNION MANUAL ADJUSTMENT KNOB UNTIL THE PRELOADED SPRING FORCES THE KNOB WELL ABOVE THE SURFACE OF THE OPTICAL UNIT PANEL
   b) LIBERALLY APPLY THERMOCONDUCTIVE SILICONE COMPOUND, P/N 1006879, TO THE OUTSIDE DIAMETER OF THE KNOB AS SHOWN DETAIL "A" COATING THICKNESS MUST BE AMPLE ENOUGH TO FILL CLEARANCE BETWEEN KNOB OUTER DIAMETER AND PANEL COUNTERBORE (APPROXIMATELY .005 INCH PER SIDE).
   c) DEPRESS THE KNOB TO DISENGAGE THE DRIVE AND SECURE KNOB TIGHTLY TO INSURE A STATIC SEAL.
   d) REMOVE EXCESS SILICONE COMPOUND FROM KNOB AND PANEL SURFACE USING CLEAN DRY TISSUE PAPER
   e) REPEAT STEPS "a" THROUGH "d" APPLY SILICONE COMPOUND TO THE SHAFT MANUAL ADJUSTMENT KNOB.

NOTES:
1. SHADED AREAS ARE TO BE PLUGGED OR MASKED AS REQUIRED.
2. MASKING TAPE, TEMPLATE OR TOOLING MUST BE LOCATED WITH RESPECT TO THE EYEPIECE MOUNTING HOLES
3. RECORD ALL PART NUMBERS, MOD MARKS, OR I D MARKINGS WHICH WILL BE COVERED BY THE ENAMEL COAT. IF THE TRUNNION SHAFT COUNTER DESIGNATIONS ARE ENGRAVED, REMOVE THE WHITE FILTER.
4. a) UNSCREW THE TRUNNION MANUAL ADJUSTMENT KNOB UNTIL THE PRELOADED SPRING FORCES THE KNOB WELL ABOVE THE SURFACE OF THE OPTICAL UNIT PANEL
   b) LIBERALLY APPLY THERMOCONDUCTIVE SILICONE COMPOUND, P/N 1006879, TO THE OUTSIDE DIAMETER OF THE KNOB AS SHOWN DETAIL "A"
   COATING THICKNESS MUST BE AMPLE ENOUGH TO FILL CLEARANCE BETWEEN KNOB OUTER DIAMETER AND PANEL COUNTERBORE (APPROXIMATELY .005 INCH PER SIDE).
   c) DEPRESS THE KNOB TO DISENGAGE THE DRIVE AND SECURE KNOB TIGHTLY TO INSURE A STATIC SEAL
   d) REMOVE EXCESS SILICONE COMPOUND FROM KNOB AND PANEL SURFACE USING CLEAN DRY TISSUE PAPER
   e) REPEAT STEPS "a" THROUGH "d" APPLY SILICONE COMPOUND TO THE SHAFT MANUAL ADJUSTMENT KNOB.
5. RESTENCIL ALL PART NUMBERS OR I D MARKS WHICH WERE RECORDED IN NOTE 3

2. MASKING TAPE, TEMPLATE OR TOOLING MUST BE LOCATED WITH RESPECT TO THE EYEPIECE MOUNTING HOLES
3. RECORD ALL PART NUMBERS, MOD MARKS, OR I D MARKINGS WHICH WILL BE COVERED BY THE ENAMEL COAT. IF THE TRUNNION SHAFT COUNTER DESIGNATIONS ARE ENGRAVED, REMOVE THE WHITE FILTER.
4. a) UNSCREW THE TRUNNION MANUAL ADJUSTMENT KNOB UNTIL THE PRELOADED SPRING FORCES THE KNOB WELL ABOVE THE SURFACE OF THE OPTICAL UNIT PANEL
   b) LIBERALLY APPLY THERMOCONDUCTIVE SILICONE COMPOUND, P/N 1006879, TO THE OUTSIDE DIAMETER OF THE KNOB AS SHOWN DETAIL "A" COATING THICKNESS MUST BE AMPLE ENOUGH TO FILL CLEARANCE BETWEEN KNOB OUTER DIAMETER AND PANEL COUNTERBORE (APPROXIMATELY .005 INCH PER SIDE).
   c) DEPRESS THE KNOB TO DISENGAGE THE DRIVE AND SECURE KNOB TIGHTLY TO INSURE A STATIC SEAL.
   d) REMOVE EXCESS SILICONE COMPOUND FROM KNOB AND PANEL SURFACE USING CLEAN DRY TISSUE PAPER
   e) REPEAT STEPS "a" THROUGH "d" APPLY SILICONE COMPOUND TO THE SHAFT MANUAL ADJUSTMENT KNOB.

NOTES:
1. SHADED AREAS ARE TO BE PLUGGED OR MASKED AS REQUIRED.
2. MASKING TAPE, TEMPLATE OR TOOLING MUST BE LOCATED WITH RESPECT TO THE EYEPIECE MOUNTING HOLES
3. RECORD ALL PART NUMBERS, MOD MARKS, OR ID MARKINGS WHICH WILL BE COVERED BY THE ENAMEL COAT. IF THE TRUNNION SHAFT COUNTER DESIGNATIONS ARE ENGRAVED, REMOVE THE WHITE FILTER.
4. a) UNSCREW THE TRUNNION MANUAL ADJUSTMENT KNOB UNTIL THE PRELOADED SPRING FORCES THE KNOB WELL ABOVE THE SURFACE OF THE OPTICAL UNIT PANEL
   b) LIBERALLY APPLY THERMOCONDUCTIVE SILICONE COMPOUND, P/N 1006879, TO THE OUTSIDE DIAMETER OF THE KNOB AS SHOWN DETAIL "A"
   COATING THICKNESS MUST BE AMPLE ENOUGH TO FILL CLEARANCE BETWEEN KNOB OUTER DIAMETER AND PANEL COUNTERBORE (APPROXIMATELY .005 INCH PER SIDE).
   c) DEPRESS THE KNOB TO DISENGAGE THE DRIVE AND SECURE KNOB TIGHTLY TO INSURE A STATIC SEAL
   d) REMOVE EXCESS SILICONE COMPOUND FROM KNOB AND PANEL SURFACE USING CLEAN DRY TISSUE PAPER
   e) REPEAT STEPS "a" THROUGH "d" APPLY SILICONE COMPOUND TO THE SHAFT MANUAL ADJUSTMENT KNOB.
5. RESTENCIL ALL PART NUMBERS OR ID MARKS WHICH WERE RECORDED IN NOTE 3

The lateral (normal to trunnion axis) displacement of the SCT reticle "R" line, between the ends of its excursion shall be estimated utilizing the collimator reticle pattern as a reference. The variation of "R" line thus measured, which results from a lack of perpendicularity between LOS and TDA and a lack of perpendicularity between TDA and SDA, shall not exceed 2 arc minutes.

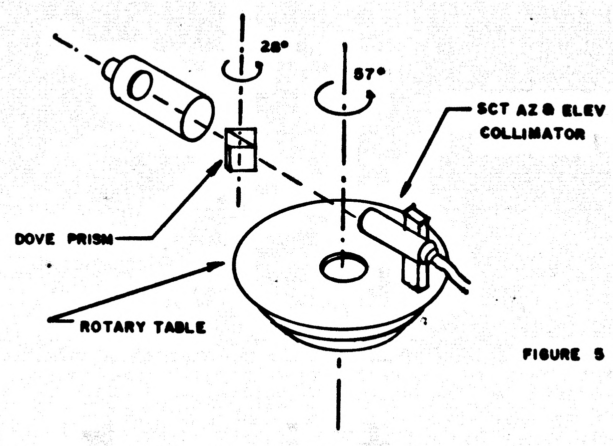

FIGURE 5

4.2.1.4 SXT TDA Accuracy

4.2.1.4.1 SXT TDA Zero Error. The SXT TDA Zero Error shall be measured by observing the SXT reticle simultaneously through the SLOS and LLOS by means of an autocollimator when the SXT TDA is set at electrical zero. The relative displacement between the two views of the reticle is the Zero Error and shall not exceed ± 3 sec.

4.2.1.4.2 SXT TDA Peak to Peak Error. The SXT TDA peak to peak error shall be based on the analysis of a series of positional measurements made with the optical unit as its index mirror is rotated about its vertically oriented trunnion axis, while the unit is in a horizontal position. The SXT shall be autocollimated via SLOS off a reference fixtures elevation mirror as shown in Figure 6. At each index mirror position, the SXT TDA 64X Resolver readout, converted to SXT Trunnion LOS angle, shall be compared to a reference rotary table position when coincidence between the SXT reticle and its reflection is achieved. The peak to peak error or maximum spread between the largest and smallest (algebraic) error measured shall be limited to 24 seconds.

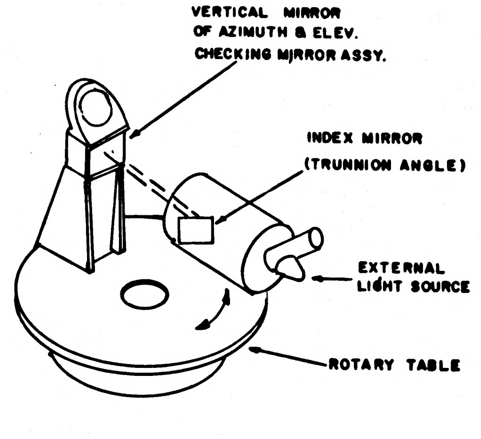

FIGURE 6

4.2.1.5 SXT SDA Accuracy. The SXT SDA accuracy shall be based on the statistical analysis of a series of positional measurements made with the SXT as it is rotated about its vertically positioned Shaft Axis. The SXT shall be autocollimated via the SLOS off the PTF 57° Azimuth Mirror as shown in Figure 7. At each position the SXT SDA 16X Resolver readout, converted to SXT Shaft Angle shall be compared to the PTF rotary table position when coincidence between the SXT reticle and its reflection is achieved. The maximum error at zero reference shall not exceed 10 arc seconds. The peak to peak error at any point shall not exceed 45 arc seconds[illegible], the standard deviation shall not exceed 10 arc seconds, and the maximum error at any point shall not exceed 30 arc seconds.

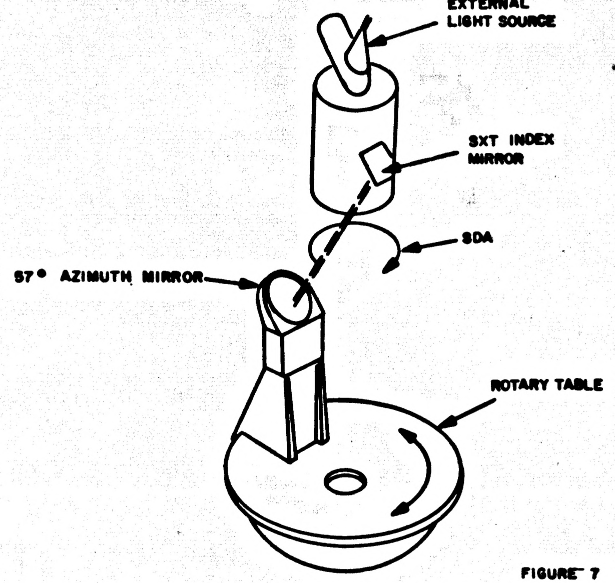

FIGURE 7

4.2.1.6 SCT TDA Electrical Accuracy. The SCT TDA electrical positional accuracy shall be based on the statistical analysis of a series of measurements made with the OUA mounted on the PTF. The PTF's rotary table and SCT azimuth and elevation collimator shall define a TDA angle which shall be compared to an electrical angle readout on the functional tester. The electrical readout represents the SXT (to which the SCT is slaved) TDA's angular position via the 64X RSVR. The OUA shall be positioned at the PTF reference angles by adjusting the SCT LOS to 0° in azimuth and aligning the SCT's reticle "M" line to the PTF's azimuth and elevation collimator as shown in Figure 8 by positioning the SXT TDA. The maximum error at zero reference shall not exceed 2 minutes. The maximum allowable error at each point shall be 8 minutes.

4.2.1.7 SCT TDA Mechanical Accuracy. The SCT TDA mechanical positional accuracy shall be measured simultaneously and by a similar statistical technique as the electrical accuracy. The PTF's rotary table and SCT azimuth and elevation collimator shall define a TDA angle which shall be compared to the angle readout the SCT TDA counter. The OUA shall be positioned at the SCT LOS to 0° in azimuth and then the SCT's reticle "M" line aligned to the PTF's azimuth and elevation collimator as shown in Figure 8. The maximum allowable error at each point shall be 2 minutes.

4.2.1.8 SCT SDA Electrical Accuracy. The SCT SDA electrical accuracy shall be based on the statistical analysis of a series of measurements made with the OUA mounted on the PTF. The PTF rotary table and SCT azimuth and elevation collimator shall define an SDA angle which shall be compared to an electrical angle readout on the functional tester. The electrical readout represents the SXT (to which the SCT is slaved) SDA's angular position via the 16X RSVR. The OUA shall be positioned at the PTF reference angles by adjusting the SCT LOS to 57° in elevation and then aligning the SCT's reticle "R" line to the PTF's azimuth and elevation collimator as shown in Figure 9 by positioning the SXT SDA. The maximum error at zero reference shall not exceed 1 minute.

The maximum allowable error at each point shall be 4 minutes.

4.2.1.9 . SCT SDA Mechanical Accuracy. The SCT SDA mechanical positional accuracy shall be measured simultaneously and by a similar statistical technique as the electrical accuracy. The PTF's rotary table and SCT azimuth and elevation collimator shall define an SDA angle which shall be compared to the angle read off the SCT SDA counter. The OUA shall be positioned at the SCT LOS to 57° in elevation and then the SCT's reticle "R" line aligned to the PTF's azimuth and elevation collimator as shown in Figure 9. The maximum allowable error at each point shall be 2 minutes.

In addition, with a low contrast target the resolution at 1/3 field radius shall be 14.4 arc seconds or better and at 2/3 field radius shall be 28.7 arc seconds or better, while the corresponding values shall be 11.5 arc seconds for 1/3 field radius and 23.0 arc seconds for 2/3 field radius if a high contrast target is being used in the test equipment.

The SCT LOS shall be positioned such that the reticle "R" line and "M" line bisect the resolution target and the SCT eyepiece shall be adjusted for optimum focus. The LOS resolution at the center of the field shall be 146 arc seconds or better if the test equipment has a low contrast target and 64.6 arc seconds or better if it has a high contrast target.

The SCT LOS shall be positioned such that the 15 or 35 gradicule bisects the resolution target. The LOS resolution, at approximately 1/3 field radius, shall be 230 arc seconds or better if the test equipment has a low contrast target and 91.5 arc seconds or better if it has a high contrast target.

The SCT LOS shall be positioned such that the 5 or 45 gradicule bisects the resolution target. The LOS resolution, at approximately 2/3 field radius, shall be 328 arc seconds or better if the test equipment has a low contrast target and 184 arc seconds or better if it has a high contrast target.

4.2.1.11 Air/Vacuum Focusing. The focus adjustment of each eyepiece shall be measured by means of a dioptmeter. Each eyepiece shall be mounted in place with sufficient entrance light to illuminate the air and vacuum reticle to which the focus is set. The adjustable SXT Standard eyepiece shall have a focusing range of -2 to +2 diopters. All other eyepieces are fixed and shall be set at a -1 ± .25 diopter focus.

4.2.1.12 Luminous Transmittance. The luminous transmittance at the assembly lines of sight shall be tested using a CIE illuminant "C" as a light source and a light transmittance meter to monitor the light intensity. The light intensity at the source (I_o) shall be measured prior to testing the assembly.

The assembly shall be positioned such that the light emitted from the source enters the eyepiece and appears centralized in the optics when viewed via the objective lens. The light intensity at the objective lens (I_R) shall then be measured with the transmittance meter. The luminous transmittance shall be determined as follows:

Intensity Ratio ($I_R : I_o$) X 100 = % Transmittance. The luminous transmittance of the SXT LLOS to CIE illuminate "C" shall not be less than 4%.

The luminous transmittance of the SCT to CIE illuminate "C" shall not be less than 30%.

The luminous transmittance of the SXT SLOS shall be tested as specified above while monitoring the light intensity at the SXT Indexing Mirror. The luminous transmittance of the SXT SLOS to CIE illuminate "C" shall not be less than 25%.

If the assembly configuration includes an eyepiece polaroid filter then the following test shall be performed:

The ratio of the luminous transmittance of the SXT SLOS and SXT LLOS shall be less than 12 to 1 for CIE illuminant "C" when the eyepiece polaroid filter is positioned for minimum transmission through the LLOS.

4.2.1.13 Freedom of Motion. Unscrew and pop out the SCT Shaft Manual Input Adapter and rotate control. SCT Shaft shall move freely. Unscrew and pop out the SCT Trunnion Manual Input Adapter and rotate control. SCT Trunnion shall move freely.

4.2.1.14 SXT TDA and SDA Dynamic Friction, Stiction, and Rate Generator Phasing. With a variable AC, 800 cps, input voltage applied to the Motor-Generator control windings, the voltage shall be increased until the SXT Shaft or trunnion starts to rotate. The input voltage shall not exceed 5.3 VAC. The input voltage shall then be decreased to the lowest level required to maintain rotation. The input voltage shall not exceed 4.2 VAC.

With the use of a phase sensitive voltmeter, the generator output voltage, for an increasing angular rotation of the shaft (SDA) shall cause the meter to deflect in a negative direction and in a positive direction for a decreasing angular rotation of the shaft. The generator output voltage for an increasing angular rotation of the trunnion (TDA) shall cause the meter to deflect in a positive direction and in a negative direction for decreasing angular rotation of the trunnion.

4.2.1.15 SCT TDA and SDA Dynamic Friction, Stiction, and Rate Generator Phasing. With a variable AC 800 cps, input voltage applied to the Motor-Generator control windings, the voltage shall be increased until the SCT shaft or trunnion starts to rotate. The input voltage shall not exceed 6.6 VAC when the shaft or trunnion is at the shade flip position, or 5.3 VAC at all other positions. The input voltage shall then be decreased to the lowest level required to maintain rotation. The input voltage shall not exceed 4.2 VAC.

With the use of a phase sensitive voltmeter, the generator output voltage for an increasing angular rotation of the shaft (SDA), shall cause the meter to deflect in a positive direction and the generator output for a decreasing angular rotation of the shaft shall cause the meter to deflect in a negative direction. The generator output voltage for an increasing angular rotation of the trunnion (TDA) shall cause the meter to deflect in a negative direction and in a positive direction for a decreasing angular rotation of the trunnion.

4.2.1.16 Reticle Lighting. Reticle lamp operation shall be determined by means of their current drain and visual check. The current shall be measured by means of a milliammeter when 5.0 VAC is applied across each bank of 4 parallel lamps that illuminate the SXT and SCT reticles. The current drain shall be within 10% of the current measurements previously made while the lamp illumination could be observed and a visual check will be performed to show that the reticle appears illuminated when viewed via the eyepieces.

The fundamental components of the tracker preamplifier output shall be as specified in Table III for each corresponding star displacement from null with a wave analyzer and an A.C. Voltmeter.

The error signal gradient shall then be tested wiht a +2.6 volt AGC signal applied to the OUA and utilizing a +1.0 magnitude, simulated 6 second star. The star shall be positioned to obtain a minimum output of both fundamental components of the tracker preamplifier output. The star shall then be displaced 1, 2, 3, 4, and 5 minutes from null along both shaft and trunnion coordinates. The fundamental components of the preamplifier output shall be as specified in Table III for each corresponding star displacement.

4.2.1.21 Star Presence. With a 0 volt AGC signal applied to the Tracker High Voltage Power Supply, the Power Supply Star presence output shall be less than 5.0 volts as measured with a D.C. Voltmeter.

With a +2.0 volt AGC signal applied to the Tracker High Voltage Power Supply, the Power Supply star presence output shall be greater than 14.0 volts as measured with a D.C. Voltmeter.

4.2.1.22 Tracker LOS to SXT Star LOS. With a simulated 0 magnitude star positioned in the tracker field of view and a +3.4 volt AGC signal applied to the assembly; the star shall be translated in both trunnion and cross-trunnion directions to obtain a minimum output of both fundamental components of the tracker preamplifier output and the star position established. The star, viewed along the SXT LOS, shall then be positioned to the center of the SXT reticle and the star position shall be established again. The difference between the two star positions shall not exceed 20 arc seconds in the trunnion direction and 3 arc minutes in the cross-trunnion direction. The error angle shall be known to within 10 arc seconds relative to the error angle specified for the Tracker LOS.

A simulated horizon having a 30 minute minimum diameter and initial intensity equivalent to 9.5×10^{-4} watts/steradian/cm^2 distributed between 3400 and 3600 Å shall be positioned on the photometer optical axis. The fundamental component of the photometer preamplifier output shall be between 125 and 250 millivolts. These tests shall be made using a wave analyzer and an A.C. Voltmeter.

The simulated horizon intensity shall then be decreased, from its initial value, to one-half its initial value. The fundamental component of the preamplifier output shall be one-half the output obtained at initial value horizon intensity, ± 5%.

The simulated horizon intensity shall then be decreased, from one-half its initial value, to one-fourth its initial value. The fundamental component of the preamplifier output shall be one-half the output obtained at one-half initial value horizon intensity, ± 5%.

Similarly, the star shall then be positioned to the "known" center determined above, and the fundamental component of the preamplifier output monitored as the star is translated in the cross-trunnion direction. The preamplifier output, graphically plotted versus the position of the star, determines the center of the aperture, as above.

The star shall be positioned to the center of the aperture in both trunnion and cross-trunnion directions. The position of the star shall be measured. The star, viewed via the SXT LLOS, shall then be positioned on the SXT reticle center and the star position measured. The difference between the two star positions shall not exceed 3 arc minutes. The error angle shall be known to within 10 arc seconds relative to the error angle specified for the photometer LOS.

4.2.1.6 SCT TDA Electrical Accuracy. The SCT TDA electrical positional accuracy shall be based on the analysis of a series of measurements made with the OUA mounted on the PTF. The PTF's rotary table and SCT azimuth and elevation collimator shall define a TDA angle which shall be compared to an electrical angle readout on the functional tester. The electrical readout represents the SXT (to which the SCT is slaved) TDA's angular position via the 64X RSVR. The OUA shall be positioned at the PTF reference angles by adjusting the SCT LOS to 0° in azimuth and aligning the SCT's reticle "M" line to the PTF's azimuth and elevation collimator as shown in Figure 8 by positioning the SXT TDA. The maximum error at zero reference shall not exceed 2 minutes. The maximum allowable error at each point shall be 8 minutes.

4.2.1.7 SCT TDA Mechanical Accuracy. The SCT TDA mechanical positional accuracy shall be measured simultaneously and by a similar technique as the electrical accuracy. The PTF's rotary table and SCT azimuth and elevation collimator shall define a TDA angle which shall be compared to the angle readout the SCT TDA counter. The OUA shall be positioned at the SCT LOS to 0° in azimuth and then the SCT's reticle "M" line aligned to the PTF's azimuth and elevation collimator as shown in Figure 8. The maximum allowable error at each point shall be 2 minutes.

4.2.1.8 SCT SDA Electrical Accuracy. The SCT SDA electrical accuracy shall be based on the analysis of a series of measurements made with the OUA mounted on the PTF. The PTF rotary table and SCT azimuth and elevation collimator shall define an SDA angle which shall be compared to an electrical angle readout on the functional tester. The electrical readout represents the SXT (to which the SCT is slaved) SDA's angular position via the 16X RSVR. The OUA shall be positioned at the PTF reference angles by adjusting the SCT LOS to 57° in elevation and then aligning the SCT's reticle "R" line to the PTF's azimuth and elevation collimator as shown in Figure 9 by positioning the SXT SDA. The maximum error at zero reference shall not exceed 1 minute.

The maximum allowable error at each point shall be 4 minutes.

4.2.1.9 SCT SDA Mechanical Accuracy. The SCT SDA mechanical positional accuracy shall be measured simultaneously and by a similar technique as the electrical accuracy. The PTF's rotary table and SCT azimuth and elevation collimator shall define an SDA angle which shall be compared to the angle read off the SCT SDA counter. The OUA shall be positioned at the SCT LOS to 57° in elevation and then the SCT's reticle "R" line aligned to the PTF's azimuth and elevation collimator as shown in Figure 9. The maximum allowable error at each point shall be 2 minutes.

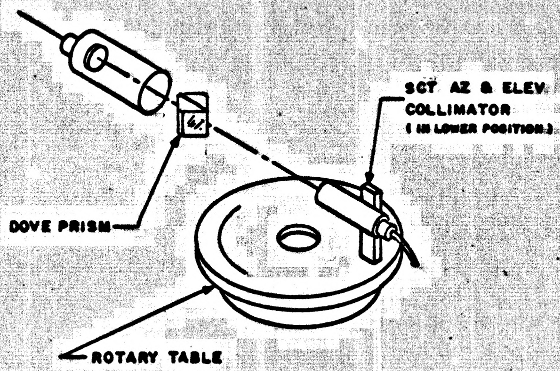

FIGURE 8

4.2.1.12 Luminous Transmittance. The luminous transmittance at the assembly lines of sight shall be tested using a CIE illuminant "C" as a light source and a light transmittance meter to monitor the light intensity. The light intensity at the source (Io) shall be measured prior to testing the assembly.

The assembly shall be positioned such that the light emitted from the source enters the eyepiece and appears centralized in the optics when viewed via the objective lens. The light intensity at the objective lens (I_R) shall then be measured with the transmittance meter. The luminous transmittance shall be determined as follows:

Intensity Ratio ($I_R : I_o$) X 100 = % Transmittance. The luminous transmittance of the SXT LLOS to CIE illuminate "C" shall not be less than 4%.

The luminous transmittance of the SCT to CIE illuminate "C" shall not be less than 30%.

The luminous transmittance of the SXT SLOS shall be tested as specified above while monitoring the light intensity at the SXT Indexing Mirror. The luminous transmittance of the SXT SLOS to CIE illuminate "C" shall not be less than 25%.

If the assembly configuration includes an eyepiece polaroid filter then the following test shall be performed:

The ratio of the luminous transmittance of the SXT SLOS and SXT LLOS shall not be less than 12 to 1 for CIE illuminant "C" when the eyepiece polaroid filter is positioned for minimum transmission through the LLOS.

With the use of a phase sensitive voltmeter, the generator output voltage for an increasing angular rotation of the shaft (SDA), shall cause the meter to deflect in a positive direction and the generator output for a decreasing angular rotation of the shaft shall cause the meter to deflect in a negative direction. The generator output voltage for an increasing angular rotation of the trunnion (TDA) shall cause the meter to deflect in a negative direction and in a positive direction for a decreasing angular rotation of the trunnion.

4.2.1.16 Reticle Lighting. Reticle lamp operation shall be determined by means of their current drain and visual check. The current shall be measured by means of a milliammeter when 5.0 VAC is applied across each bank of 4 parallel lamps that illuminate the SXT and SCT reticles. The current drain shall be within 10% of the current measurements previously made while the lamp illumination could be observed and a visual check will be performed to show that the reticle appears illuminated when viewed via the eyepieces.

4.2.1.17 Dark Noise. With input power applied to the OUA, a 2 volt AGC signal applied to the Tracker High Voltage Power Supply, and the SCT head covered with a opaque black cloth; the tracker preamplifier output shall not exceed 1.0 volts rms when measured with a wide band meter.

4.2.1.18 Reference Voltage. The tuning fork reference voltages measured at the outputs of the X and Y Drive Amplifiers shall be greater than 6 volts peak-to-peak as measured with an oscilloscope.

4.2.1.19 Tracker Frequency. The signal frequencies measured at the Tracker fork reference outputs shall be 455 ± 1 cps and 356 ± 1 cps as measured with a frequency counter.

4.2.1.20 Error Signal Gradient. With a + 2.0 volt AGC signal applied to the OUA, a + 2.0 magnitude, simulated 6 second star shall be positioned, in the tracker field of view, to obtain a minimum output of both fundamental components of the tracker preamplifier output when utilizing a wave analyzer and an A.C. Voltmeter.

4.2.1.21 Star Presence. With a 0 volt AGC signal applied to the Tracker High Voltage Power Supply, the Power Supply Star presence output shall be less than 5.0 volts as measured with a D.C. Voltmeter.

With a + 2.0 volt AGC signal applied to the Tracker High Voltage Power Supply, the Power Supply star presence output shall be greater than 14.0 volts as measured with a D.C. Voltmeter.

4.2.1.22 Tracker LOS to SXT Star LOS. With a simulated -4 magnitude star positioned in the tracker field of view and a + 4.8 volt AGC signal applied to the assembly; the star shall be translated in both trunnion and cross-trunnion directions to obtain a minimum output of both fundamental components of the tracker preamplifier output and the approximate star position established. The exact star position shall then be established by graphical extrapolation of X and Y error signal gradients. The star, viewed along the SXT LOS, shall then be positioned to the center of the SXT reticle and the star position shall be established again. The difference between the two star positions shall not exceed 20 arc seconds in the trunnion direction and 3 arc minutes in the cross-trunnion direction. The error angle shall be known to within 10 arc seconds relative to the error angle specified for the Tracker LOS.

4.2.1.23 Horizon Photometer Output. A simulated horizon having a 30 minute minimum diameter and initial intensity equivalent to 9.5×10^{-4} watts/steradian/cm^2 distributed between 3400 and 3600 Å shall be positioned on the photometer optical axis. The fundamental component of the photometer preamplifier output shall be between 125 and 250 millivolts. These tests shall be made using a wave analyzer and an A.C. Voltmeter.

The simulated horizon intensity shall then be decreased, from its initial value, to one-half its initial value. The fundamental component of the preamplifier output shall be one-half the output obtained at initial value horizon intensity, ± 5%.

The simulated horizon intensity shall then be decreased, from one-half its initial value, to one-fourth its initial value. The fundamental component of the preamplifier output shall be one-half the output obtained at one-half initial value horizon intensity, ± 5%.

4.2.1.24 Photometer Fork Frequency. The fundamental component of the signal frequency measured at the photometer preamplifier output shall be 550 cps ± 1 cps using a wave analyzer and a frequency counter.

4.2.1.25 Photometer LOS to SXT LLOS. A simulated star shall be positioned in the photometer field of view. The fundamental component of the photometer preamplifier output shall be monitored as the star is translated in the trunnion direction and the preamplifier output graphically plotted versus the position of the star. The center of the aperture in the trunnion direction, shall be determined by analyzing this plot.

Similarly, the star shall then be positioned to the "known" center determined above, and the fundamental component of the preamplifier output monitored as the star is translated in the cross-trunnion direction. The preamplifier output, graphically plotted versus the position of the star, determines the center of the aperture, as above.

The star shall be positioned to the center of the aperture in both trunnion and cross-trunnion directions. The position of the star shall be measured. The star, viewed via the SXT LLOS, shall then be positioned on the SXT reticle center and the star position measured. The difference between the two star positions shall not exceed 3 arc minutes in the trunnion direction and 3 arc minutes in the cross trunnion direction. The error angle shall be known to within 10 arc seconds relative to the error angle specified for the photometer LOS.

4.2.1.26 Baseline Performance. See applicable portions of Section 4.

4.2.1.27 Environmental Tests. Not applicable.

4.2.1.28 Final Visual Mechanical Inspection. Not applicable.

4.2.1.29 Pressure Leak Rate. The Leak Detector shall be calibrated prior to testing. The external side of the OUA shall be evacuated and backfilled with a 10% Helium mixture of 5 psi. The leak rate shall be determined using the following formula. The leak rate shall not exceed 9.99×10^{-5} st'd cc/sec.

$$\begin{bmatrix}\text{Unit Leak Rate}\\ \text{St'd cc/sec-He}\end{bmatrix} = \frac{\begin{bmatrix}\text{Leak Detector}\\ \text{Reading}\end{bmatrix} \begin{bmatrix}\text{Calibration St'd}\\ \text{Leak Rate}\end{bmatrix.\left(\frac{\text{St'd cc He}}{\text{Sec}}\right)\Bigg]}{\begin{bmatrix}\text{Calibrated Leak}\\ \text{Detector reading}\end{bmatrix} \left[\frac{\text{\% He in Mixture}}{100}\right]}$$

4.2.1.30 Functional Performance and Repeatability. Same as section 3.3.5.

4.2.1 Test Sequence. Except as noted in Section 3.3 the sequence of Functional testing as presented herein is optional and may be performed in any order which will permit most economical use of manpower and equipment.

4.2.1.1 SXT Parallelism of Optical Axis to SDA Axis (Reticle Eccentricity). The SXT reticle shall be observed through a certified reference LOS afforded by the Precision Test Fixture's SXT Vertical Autocollimator via the LLOS as shown schematically in Figure 1. A series of angular displacement measurements of the reticle through the complete excursion of SDA shall be taken with the autocollimator filar micrometers. The results shall be charted and analysed to yield the reticle's eccentricity and SDA perpendicularity error with respect to the Assembly ball mount plane. Reticle eccentricity shall not exceed 10 seconds of arc and SDA perpendicularity shall be within 10 seconds of arc.

A series of angular displacement measurements between the SCT reticle's "R" line (reference Figure 3) and the Collimator reticle's parallel component, at the cardinal angles of SDA rotation shall be made with reference to the reticle line thickness. 4.2.1.3.1 SXT. The SXT reticle and its autocollimated SLOS reflection shall be observed through the SXT eyepiece as shown schematically in Figure 4. A series of angular displacement measurements between the reticle "R" line and its reflection, through the complete excursion of SDA, shall be made with reference to the reticle line pattern. The results shall be charted and analyzed to yield the parallelism error between the SLOS and LLOS and the eccentricity of the reflected SLOS reticle image to the SDA, both of which are related to the lack of perpendicularity between the TDA and SDA. The sum of the errors resulting from the lack of perpendicularity between the TDA and SDA and the lack of perpendicularity of the SLOS and TDA shall not exceed 20 arc seconds.

4.2.1.3.2 Orientation of SLOS to TDA. With the SXT TDA set to internally autocollimate the SLOS, the electrical angle corresponding to the coincidence of the "M" line and the reflection of the "M" line shall be recorded as the Self Collimation Angle. The position of the "R" line reflection shall be within 10 seconds of the "R" line at this position.

4.2.1.3.3 SCT. The SCT azimuth and elevation collimator shall be observed via the SCT eyepiece through an SCT TDA excursion as indicated in Figure 5. The lateral (normal to trunnion axis) displacement of the SCT reticle "R" line, between the ends of its excursion shall be estimated utilizing the collimator reticle pattern as a reference. The variation of "R" line thus measured, which results from a lack of perpendicularity between LOS and TDA and a lack of perpendicularity between TDA and SDA, shall not exceed 2 arc minutes.

4.2.1.4 SXT TDA Accuracy

4.2.1.4.1 SXT TDA Zero Error. The SXT TDA Zero Error shall be measured by observing the SXT reticle simultaneously through the SLOS and LLOS by means of an autocollimator when the SXT TDA is set at electrical zero. The relative displacement between the two views of the reticle is the Zero Error and shall not exceed ± 3 sec.

4.2.1.4.2 SXT TDA Peak to Peak Error. The SXT TDA peak to peak error shall be based on the analysis of a series of positional measurements made with the optical unit as its index mirror is rotated about its vertically oriented trunnion axis, while the unit is in a horizontal position. The SXT shall be autocollimated via SLOS off a reference fixtures elevation mirror as shown in Figure 6. At each index mirror position, the SXT TDA 64X Resolver readout, converted to SXT Trunnion LOS angle, shall be compared to a reference rotary table position when coincidence between the SXT reticle and its reflection is achieved. The peak to peak error or maximum spread between the largest and smallest (algebraic) error measured shall be limited to 24 seconds.

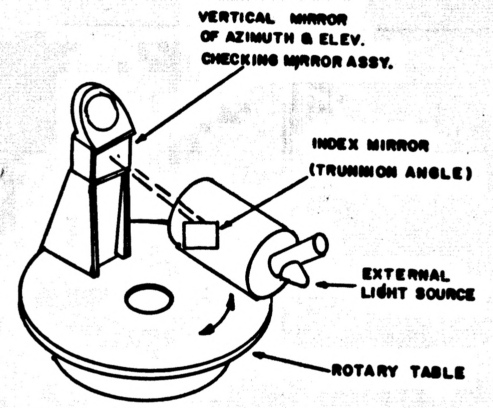

FIGURE 6

At each position the SXT SDA 16X Resolver readout, converted to SXT Shaft Angle shall be compared to the PTF rotary table position when coincidence between the SXT reticle and its reflection is achieved. The maximum error at zero reference shall not exceed 10 arc seconds. The peak to peak error at any point shall not exceed 44 arc seconds.

The electrical readout represents the SXT (to which the SCT is slaved) TDA's angular position via the 64X RSVR. The OUA shall be positioned at the PTF reference angles by adjusting the SCT LOS to 0° in azimuth and aligning the SCT's reticle "M" line to the PTF's azimuth and elevation collimator as shown in Figure 8 by positioning the SXT TDA. The maximum error at zero reference shall not exceed 2 minutes. The maximum allowable error at each point shall be 8 minutes.

The electrical readout represents the SXT (to which the SCT is slaved) SDA's angular position via the 16X RSVR. The OUA shall be positioned at the PTF reference angles by adjusting the SCT LOS to 57° in elevation and then aligning the SCT's reticle "R" line to the PTF's azimuth and elevation collimator as shown in Figure 9 by positioning the SXT SDA. The maximum error at zero reference shall not exceed 1 minute.

The maximum allowable error at each point shall be 4 minutes.

4.2.1.9 SCT SDA Mechanical Accuracy. The SCT SDA mechanical positional accuracy shall be measured simultaneously and by a similar technique as the electrical accuracy. The PTF's rotary table and SCT azimuth and elevation collimator shall define an SDA angle which shall be compared to the angle read off the SCT SDA counter. The OUA shall be positioned at the SCT LOS to 57° in elevation and then the SCT's reticle "R" line aligned to the PTF's azimuth and elevation collimator as shown in Figure 9. The LLOS resolution for patterns which are parallel to the reticle "M" lines and patterns which are parallel to the reticle "R" lines when converted to arc seconds shall be 14.4 arc seconds or better, or 10.3 arc sec or better depending on whether the test equipment used has a low or high contrast target respectively.

The fore mentioned tests shall be repeated while positioning the SXT SLOS to bisect the resolution target. The SLOS resolution at the center of the field shall be 9.1 arc sec or better or 7.2 arc seconds or better, depending on whether the test equipment used has a low or high contrast target respectively. In addition, with a low contrast target the resolution at 1/3 field radius shall be 14.4 arc seconds or better and at 2/3 field radius shall be 28.7 arc seconds or better, while the corresponding values shall be 11.5 arc seconds for 1/3 field radius and 23.0 arc seconds for 2/3 field radius if a high contrast target is being used in the test equipment.

The SCT LOS shall be positioned such that the reticle "R" line and "M" line bisect the resolution target and the SCT eyepiece shall be adjusted for optimum focus. The LOS resolution at the center of the field shall be 146 arc seconds or better if the test equipment has a low contrast target and 83 arc seconds or better if it has a high contrast target.

4.2.1.11 Air/Vacuum Focusing. The focus adjustment of each eyepiece shall be measured by means of a dioptmeter. Each eyepiece shall be mounted in place with sufficient entrance light to illuminate the air and vacuum reticle to which the focus is set. The adjustable SXT Standard eyepiece shall have a focusing range of -2 to +2 diopters. All other eyepieces are fixed and shall be set at a -1 ± .25 diopter focus.

4.2.1.12 Luminous Transmittance. The luminous transmittance at the assembly lines of sight shall be tested using a CIE illuminant "C" as a light source and a light transmittance meter to monitor the light intensity. The light intensity at the source (I_o) shall be measured prior to testing the assembly.

The assembly shall be positioned such that the light emitted from the source enters the eyepiece and appears centralized in the optics when viewed via the objective lens. The light intensity at the objective lens (I_R) shall then be measured with the transmittance meter. The luminous transmittance shall be determined as follows:

Intensity Ratio (I_R : I_o) X 100 = % Transmittance. The luminous transmittance of the SXT LLOS to CIE illuminate "C" shall not be less than 3.2%. 3.2%

The luminous transmittance of the SCT to CIE illuminate "C" shall not be less than 30%.

The luminous transmittance of the SXT SLOS shall be tested as specified above while monitoring the light intensity at the SXT Indexing Mirror. The luminous transmittance of the SXT SLOS to CIE illuminate "C" shall not be less than 25%.

If the assembly configuration includes an eyepiece polaroid filter then the following test shall be performed:

The ratio of the luminous transmittance of the SXT SLOS and SXT LLOS shall not be less than 12 to 1 for CIE illuminant "C" when the eyepiece polaroid filter is positioned for minimum transmission through the LLOS.

The input voltage shall not exceed 5.3 VAC. The input voltage shall then be decreased to the lowest level required to maintain rotation. The input voltage shall not exceed 4.2 VAC.

With the use of a phase sensitive voltmeter, the generator output voltage, for an increasing angular rotation of the shaft (SDA) shall cause the meter to deflect in a negative direction and in a positive direction for a decreasing angular rotation of the shaft. The generator output voltage for an increasing angular rotation of the trunnion (TDA) shall cause the meter to deflect in a positive direction and in a negative direction for decreasing angular rotation of the trunnion.

4.2.1.15 SCT TDA and SDA Dynamic Friction, Stiction, and Rate Generator Phasing. With a variable AC 800 cps, input voltage applied to the Motor-Generator control windings, the voltage shall be increased until the SCT shaft or trunnion starts to rotate. The input voltage shall not exceed 6.6 VAC when the shaft or trunnion is at the shade flip position, or 5.3 VAC at all other positions. The input voltage shall then be decreased to the lowest level required to maintain rotation. The input voltage shall not exceed 4.2 VAC.

With the use of a phase sensitive voltmeter, the generator output voltage for an increasing angular rotation of the shaft (SDA), shall cause the meter to deflect in a positive direction and the generator output for a decreasing angular rotation of the shaft shall cause the meter to deflect in a negative direction. The generator output voltage for an increasing angular rotation of the trunnion (TDA) shall cause the meter to deflect in a negative direction and in a positive direction for a decreasing angular rotation of the trunnion.

4.2.1.16 Reticle Lighting. Reticle lamp operation shall be determined by means of their current drain and visual check. The current shall be measured by means of a milliammeter when 5.0 VAC is applied across each bank of 4 parallel lamps that illuminate the SXT and SCT reticles. The current drain shall be within 10% of the current measurements previously made while the lamp illumination could be observed and a visual check will be performed to show that the reticle appears illuminated when viewed via the eyepieces.

4.2.1.22 Tracker LOS to SXT Star LOS. With a simulated −4 magnitude star positioned in the tracker field of view and a + 4.8 volt AGC signal applied to the assembly; the star shall be translated in both trunnion and cross-trunnion directions to obtain a minimum output of both fundamental components of the tracker preamplifier output and the approximate star position established. The exact star position shall then be established by graphical extrapolation of X and Y error signal gradients. The star, viewed along the SXT LOS, shall then be positioned to the center of the SXT reticle and the star position shall be established again. The difference between the two star positions shall not exceed 20 arc seconds in the trunnion direction and 3 arc minutes in the cross-trunnion direction. The error angle shall be known to within 10 arc seconds relative to the error angle specified for the Tracker LOS.

Similarly, the star shall then be positioned to the "known" center determined above, and the fundamental component of the preamplifier output monitored as the star is translated in the cross-trunnion direction. The preamplifier output, graphically plotted versus the position of the star, determines the center of the aperture, as above.

The star shall be positioned to the center of the aperture in both trunnion and cross-trunnion directions. The position of the star shall be measured. The star, viewed via the SXT LLOS, shall then be positioned on the SXT reticle center and the star position measured. The difference between the two star positions shall not exceed 3 arc minutes in the trunnion direction and 3 arc minutes in the cross trunnion direction. The error angle shall be known to within 10 arc seconds relative to the error angle specified for the photometer LOS.

The fore mentioned tests shall be repeated while positioning the SXT SLOS to bisect the resolution target. The SLOS resolution at the center of the field shall be 9.1 arc sec or better or 7.2 arc seconds or better, depending on whether the test equipment used has a low or high contrast target respectively. In addition, with a low contrast target the resolution at 1/3 field radius shall be 14.4 arc seconds or better and at 2/3 field radius shall be 28.7 arc seconds or better, while the corresponding values shall be 11.5 arc seconds for 1/3 field radius and 23.0 arc seconds for 2/3 field radius if a high contrast target is being used in the test equipment.

The SCT LOS shall be positioned such that the reticle "R" line and "M" line bisect the resolution target and the SCT eyepiece shall be adjusted for optimum focus. The LOS resolution at the center of the field shall be 146 arc seconds or better if the test equipment has a low contrast target and 64.6 arc seconds or better if it has a high contrast target.

The SCT LOS shall be positioned such that the 15 or 35 gradicule bisects the resolution target. The LOS resolution, at approximately 1/3 field radius, shall be 230 arc seconds or better if the test equipment has a low contrast target and 91.5 arc seconds or better if it has a high contrast target.

The SCT LOS shall be positioned such that the 5 or 45 gradicule bisects the resolution target. The LOS resolution, at approximately 2/3 field radius, shall be 328 arc seconds or better if the test equipment has a low contrast target and 184 arc seconds or better if it has a high contrast target.

4.2.1.11 Air/Vacuum Focusing. The focus adjustment of each eyepiece shall be measured by means of a dioptmeter. Each eyepiece shall be mounted in place with sufficient entrance light to illuminate the air and vacuum reticle to which the focus is set. The adjustable SXT Standard eyepiece shall have a focusing range of -2 to +2 diopters. All other eyepieces are fixed and shall be set at a -1 ± .25 diopter focus.

4.2.1.12 Luminous Transmittance. The luminous transmittance at the assembly lines of sight shall be tested using a CIE illuminant "C" as a light source and a light transmittance meter to monitor the light intensity. The light intensity at the source (Io) shall be measured prior to testing the assembly.

The assembly shall be positioned such that the light emitted from the source enters the eyepiece and appears centralized in the optics when viewed via the objective lens. The light intensity at the objective lens (I_R) shall then be measured with the transmittance meter. The luminous transmittance shall be determined as follows:

Intensity Ratio ($Io:I_R$) X 100 = % Transmittance. The luminous transmittance of the SXT LLOS to CIE illuminate "C" shall not be less than 4%.

The luminous transmittance of the SCT to CIE illuminate "C" shall not be less than 30%.

The luminous transmittance of the SXT SLOS shall be tested as specified above while monitoring the light intensity at the SXT Indexing Mirror. The luminous transmittance of the SXT SLOS to CIE illuminate "C" shall not be less than 25%.

If the assembly configuration includes an eyepiece polaroid filter then the following test shall be performed:

The ratio of the luminous transmittance of the SXT SLOS and SXT LLOS shall be less than 12 to 1 for CIE illuminant "C" when the eyepiece polaroid filter is positioned for minimum transmission through the LLOS.

4.2.1.13 Freedom of Motion. Unscrew and pop out the SCT Shaft Manual Input Adapter and rotate control. SCT Shaft shall move freely. Unscrew and pop out the SCT Trunnion Manual Input Adapter and rotate control. SCT Trunnion shall move freely.

4.2.1.14 SXT TDA and SDA Dynamic Friction, Stiction, and Rate Generator Phasing. With a variable AC, 800 cps, input voltage applied to the Motor-Generator control windings, the voltage shall be increased until the SXT Shaft or trunnion starts to rotate. The input voltage shall not exceed 5.3 VAC. The input voltage shall then be decreased to the lowest level required to maintain rotation. The input voltage shall not exceed 4.2 VAC.

With the use of a phase sensitive voltmeter, the generator output voltage, for an increasing angular rotation of the shaft (SDA) shall cause the meter to deflect in a negative direction and in a positive direction for a decreasing angular rotation of the shaft. The generator output voltage for an increasing angular rotation of the trunnion (TDA) shall cause the meter to deflect in a positive direction and in a negative direction for decreasing angular rotation of the trunnion.

4.2.1.15 SCT TDA and SDA Dynamic Friction, Stiction, and Rate Generator Phasing. With a variable AC 800 cps, input voltage applied to the Motor-Generator control windings, the voltage shall be increased until the SCT shaft or trunnion starts to rotate. The input voltage shall not exceed 6.6 VAC when the shaft or trunnion is at the shade flip position, or 5.3 VAC at all other positions. The input voltage shall then be decreased to the lowest level required to maintain rotation. The input voltage shall not exceed 4.2 VAC.

With the use of a phase sensitive voltmeter, the generator output voltage for an increasing angular rotation of the shaft (SDA), shall cause the meter to deflect in a positive direction and the generator output for a decreasing angular rotation of the shaft shall cause the meter to deflect in a negative direction. The generator output voltage for an increasing angular rotation of the trunnion (TDA) shall cause the meter to deflect in a negative direction and in a positive direction for a decreasing angular rotation of the trunnion.

4.2.1.16 Reticle Lighting. Reticle lamp operation shall be determined by means of their current drain. The current shall be measured by means of a milliammeter when 5.0 VAC is applied across each bank of 4 parallel lamps that illuminate the SXT and SCT reticles. The current drain shall be within 10% of the current measurements previously made while the lamp illumination could be observed.

4.2.1.17 Dark Noise. With input power applied to the OUA, a 0 volt AGC signal applied to the Tracker High Voltage Power Supply, and the SCT head covered with a opaque black cloth;the tracker preamplifier output shall not exceel 10 volts rms when measured with a wide band meter.

4.2.1.18 Reference Voltage. The tuning fork reference voltages measured at the outputs of the X and Y Drive Amplifiers shall be greater than 6 volts peak-to-peak as measured with an oscilloscope.

4.2.1.19 Tracker Frequency. The fundamental component of the signal frequencies measured at the Tracker preamplifier output shall be 455 cps ± 1 cps and 356 ± 1 cps respectively as measured with a wave analyzer and frequency counter.

4.2.1.20 Error Signal Gradient. With a +1.8 volt AGC signal applied to the OUA, a +2.0 magnitude, simulated 6 second star shall be positioned, in the tracker field of view, to obtain a minimum output of both fundamental components of the tracker preamplifier output when utilizing a wave analyzer and an A.C. Voltmeter.

The star shall then be off set from null, to each position specified in Table III, along the Shaft axis coordinate and then along the Trunnion axis coordinate. The fundamental components of the tracker preamplifier output shall be as specified in Table III for each corresponding star displacement from null with a wave analyzer and an A.C. Voltmeter.

The error signal gradient shall then be tested with a +2.6 volt AGC signal applied to the OUA and utilizing a +1.0 magnitude, simulated 6 second star. The star shall be positioned to obtain a minimum output of both fundamental components of the tracker preamplifier output. The star shall then be displaced 1, 2, 3, 4, and 5 minutes from null along both shaft and trunnion coordinates. The fundamental components of the preamplifier output shall be as specified in Table III for each corresponding star displacement.

4.2.1.21 Star Presence. With a 0 volt AGC signal applied to the Tracker High Voltage Power Supply, the Power Supply Star presence output shall be less than 5.0 volts as measured with a D.C. Voltmeter.

With a +2.0 volt AGC signal applied to the Tracker High Voltage Power Supply, the Power Supply star presence output shall be greater than 14.0 volts as measured with a D.C. Voltmeter.

4.2.1.22 Tracker LOS to SXT Star LOS. With a simulated 0 magnitude star positioned in the tracker field of view and a +3.4 volt AGC signal applied to the assembly; the star shall be translated in both trunnion and cross-trunnion directions to obtain a minimum output of both fundamental components of the tracker preamplifier output and the star position established. The star, viewed along the SXT SLOS, shall then be positioned to the center of the SXT reticle and the star position shall be established again. The difference between the two star positions shall not exceed 1 arc minute in the trunnion direction and 3 arc minutes in the cross-trunnion direction. The error angle shall be known to within 10 arc seconds relative to the error angle specified for the Tracker LOS.

4.2.1.23 Horizon Photometer Output. A simulated horizon having a 30 minute minimum diameter and initial intensity equivalent to 4.75×10^{-6} watts/steradian/cm^2/Å shall be positioned on the photometer optical axis. The fundamental component of the photometer preamplifier output shall be 275 millivolts ± 10%. These tests shall be made using a wave analyzer and an A.C. Voltmeter.

The simulated horizon intensity shall then be decreased from its initial valve to one-half its initial valve (2.375×10^{-6} watts/steradian/cm^2/Å). The fundamental component of the preamplifier output shall be one-half the output attained a one-half initial value horizon intensity ± 5%.

4.2.1.24 Photometer Fork Frequency. The fundamental component of the signal frequency measured at the photometer preamplifier output shall be 550 cps ± 1 cps using a wave analyzer and a frequency counter.

4.2.1.25 Photometer LOS to SXT LLOS. A simulated star shall be positioned in the photometer field of view. The fundamental component of the photometer preamplifier output shall be monitored as the star is translated in the trunnion direction and the preamplifier output graphically plotted versus the position of the star. The center of the aperture in the trunnion direction, shall be determined by analyzing this plot.

Similarly, the star shall then be positioned to the "known" center determined above, and the fundamental component of the preamplifier output monitored as the star is translated in the cross-trunnion direction. The preamplifier output, graphically plotted versus the position of the star, determines the center of the aperture, as above.

The star shall be positioned to the center of the aperture in both trunnion and cross-trunnion directions. The position of the star shall be measured. The star, viewed via the SXT LLOS, shall then be positioned on the SXT reticle center and the star position measured. The difference between the two star positions shall not exceed 3 arc minutes. The error angle shall be known to within 10 arc seconds relative to the error angle specified for the photometer LOS.

4.2.1.26 Baseline Performance. See applicable portions of Section 4.

4.2.1.27 Environmental Tests. Not applicable.

4.2.1.29 Pressure Leak Rate. The Leak Detector shall be calibrated prior to testing. The external side of the OUA shall be evacuated and back-filled with a 10% Helium mixture of 5 psi. The leak rate shall be determined using the following formula. The leak rate shall not exceed 9.99×10^{-5} st'd cc/sec.

$$\left[\begin{matrix}\text{Unit Leak Rate}\\ \text{St'd cc/sec-He}\end{matrix}\right] = \frac{\left[\begin{matrix}\text{Leak Detector}\\ \text{Reading}\end{matrix}\right] \left[\begin{matrix}\text{Calibration St'd}\\ \text{Leak Rate}\end{matrix} \left(\frac{\text{St'd cc He}}{\text{Sec}}\right)\right]}{\left[\begin{matrix}\text{Calibrated Leak}\\ \text{Detector reading}\end{matrix}\right] \left[\begin{matrix}\text{\% He in Mixture}\end{matrix}\right]}$$

4.2.1.30 Functional Performance and Repeatability. Same as section 3.3.5.

4.2.2 Drawing Compliance. The assembly shall be visually examined for compliance to the requirements of Apollo G&N Drawing 2011000. Particular attention shall be given to inspection for nicks, scratches, burrs, dents, encapsulants, defects, contaminants, pin misalignment, and legibility and appearance of markings.
